

Extra Life For Older Tric Solvent Degreasers

An Alternative double enclosure upgrade option will allow some older plants to continue after 2010 restrictions.

Layton Technologies is offering an upgrade option for older trichloroethylene degreasing equipment that may allow companies to comply with the latest requirement for the supply of tric after Oct 2010.

In a new industry code due to come into force in October 2010 solvent suppliers are insisting that solvent degreasing plants must have a double enclosure to minimise emissions and exposure levels and will not supply companies who do not meet this requirement.

Many companies will be forced to scrap their equipment which will put additional cost pressures on already struggling manufacturing businesses.

The Layton upgrade option provides the necessary double enclosure and has a simple internal handling system to transport work baskets from the load station to the degreasing tank, at the same time controlling the door operation to prevent losses and exposure

Layton can provide advice on the viability of their up-grade solution for individual machines, together with costs comparison of other alternatives.

The double enclosure upgrade option sits alongside a range of other solutions from Layton for companies faced with parts cleaning problems especially regarding compliance with regulations or wishing to change to alternative methods of cleaning and cleaning chemistries.
